Figure 11: Credential creation

Offboarded counterparties have their credentials revoked using the user-data registry.

8. Use-cases

SiriusKYC is a dynamic solution that can cater to multiple use-cases, including the below.

- **Consortium:** An association of companies with the same standard of KYC compliance can use SiriusKYC to share customers. Fast customer onboarding would improve user experience and increase customer exposure to extended services or products.
- **B2B:** A platform for business-to-business transactions can use SiriusKYC to create a marketplace with verifiable and reputable trade partners. Users can have a verifiable, portable reputation to build credibility with their counterparts. Buyers and suppliers can grow their businesses with confidence.
- **Supply chain:** Supply chain counterparts can use SiriusKYC to ensure ethical sourcing and sanctions-compliance. Counterparty verification can occur at each stage of a supply chain by merely scanning a QR code.
